Black Holes

Deep in space there are things called black holes. A black hole is special. It is like a vacuum cleaner. It pulls in everything around it. It can pull in rocks. It can even pull in light. A black hole is black because there is no light.

Black holes are far away from us. We can't see them without a special tool. We know they are there because we can see what they do. Black holes are some of the most amazing objects in space.
