### Helicopters

A helicopter is different from a plane. Unlike a plane, it has blades on top. The blades are called a *rotor*. When the rotor turns fast, the helicopter takes off. A helicopter does not need a runway because it goes straight up in the air. It can even stop in the air like a hummingbird.

Helicopters are important. They are used in many different ways. They are used to watch traffic to keep the highways safe. They carry things to places where there are no roads. Helicopters carry sick people over traffic to hospitals. Watch for a helicopter flying in the sky. Think about how it is being used to help people.
